The Supreme Court's action comes after a federal appeals court late Thursday set a deadline of March 16 for the high court to resolve the travel ban case. In a series of orders Friday, the Supreme Court allowed the ban to remain in effect during the time it takes for the federal court's decision on the case to make its way to the justices. The Supreme Court justices did not rule on any new legal issues in the case but effectively confirmed a prior ruling against the travel ban — a response to the 9th U.S. Circuit Court of Appeals decision. The court was called upon to decide whether the ban violates the U.S. Constitution's prohibition against discrimination against Muslims. On Thursday, a three-judge panel of the 9th Circuit said the ban — which temporarily restricts travel from six predominantly Muslim countries — violated the Constitution's religious freedom protections. The court also said it effectively disrespected the role of the executive branch, making the ban unworkable. The case has proved difficult for the Trump administration to win, with the Department of Justice arguing the ban does not violate the Constitution. The 9th Circuit case is now on appeal to the Supreme Court, which could issue a ruling in months. President Trump called on the justices to reverse the decision late Thursday.

Alcohol use by arthroplasty patients has received increasing attention due to its deleterious effects on prosthetic function, revision rates, and revision costs. This meta-analysis assessed whether alcohol has an effect on the rate of postoperative complications after primary total knee replacement (TKR). A literature search identified 11 studies (1918 cases) with a common control (no alcohol use) and two experimental (alcohol use) arms. A random-effects model meta-analysis of the three studies found that alcohol use was associated with a significantly higher rate of postoperative thrombotic events (odds ratio [OR], 1.64; 95% confidence interval [CI], 1.02-2.62), wound complications (OR, 1.77; 95% CI, 1.03-3.03), and wound infections (OR, 1.74; 95% CI, 1.01-3.04). However, these effects were not significant after adjusting for confounders. There was no effect of alcohol use on the rate of postoperative complications, the length of hospital stay, readmission, revision, and postoperative infections (healing of prosthetic joints).According to the NIH, a TBI is a brain injury caused by a bump, blow, or jolt to the head that disrupts the normal function of the brain. Tragically, due to the lack of knowledge about the effects of TBI and lack of qualified resources to aid the injured, TBI is often overlooked or under-diagnosed.
