The long term goal is to achieve a high rate of embryo production in captivity to maintain a breeding colony of psittacine birds in North America. Studies will be made on the first three days of the incubation period to determine the growth rates of the eggs and to develop ways to increase the fertilization. Methods of incubation will be compared in which the eggs are incubated in an oil layer, a conventional eggshell or an eggshell membrane. The onset of embryonic activity will be used as an indication of successful hatching. Procedures for testing egg fertility by inseminating two or three eggs in a clutch will be tested in which only one of the eggs is incubated, in order to increase the likelihood of successful fertilization. Also, an attempt will be made to determine the effect of various substances on the ovum fertilizing ability. Research will be carried out to make possible the use of spermatozoa from the cloaca of day 10 embryos. The major thrust of this research will be to continue to develop methods for the production of avian embryos in captivity, specifically for the maintenance of psittacine birds. MAC OS Windows Introduction The primary goal of this course is to teach you how to build a stock cube withing TensorFlow. The course is a fairly extensive one, as it takes the student all the way from understanding basic flow control (if, else) statements, building a TensorFlow network, executing the network, iterating over the network, iterating over the dataset, and evaluating the network. I'm hoping to teach you a few things here: You can build an end to end stock cube using TensorFlow and Ker
